

New feature: photo validation on Urgentys and PERS Mobile

Medical Intelligence are pleased to announce an exciting new feature on their Urgentys and PERS Mobile products whereby a full colour photograph can be sent to be displayed on the colour screen of the device.

This application was initially requested by a potential client who wanted to send pictures of known suspects to security guards operating in a retail environment, as can be seen in this picture.

As well as the wide range of security applications there are also applications in telecare, for example, the face of a health visitor can be sent to a PERS Mobile wearer to validate their appearance prior to entry into a wearer's home or a picture of an object can be sent as a reminder to those with learning difficulties.
